

Technical documentation projects

Creating and updating operating manuals, maintenance manuals and spare parts catalogs.

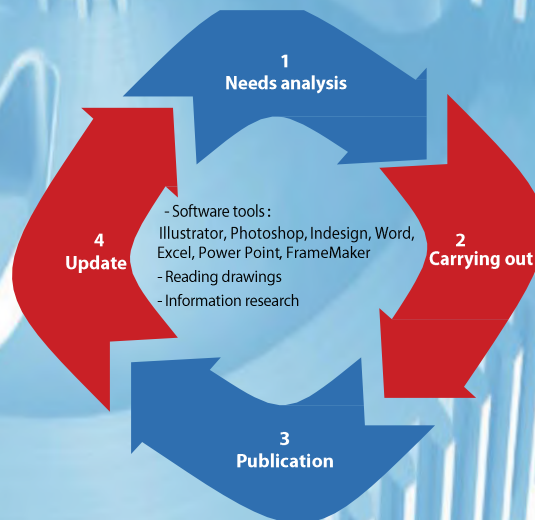

We carry out these types of service on behalf of major regional industrials.

The role of our technical writers is to provide understanding and ease use of the machines. With a clear and concise (relevant) language, adapted to the concerned public, our technical writers put themselves on the same level as the document users.

Our technicians and engineers have good writing and teaching skills, good analytical and synthesis methods.

Our services consist of:

- Collecting the needs of interlocutors.
- Being an interface between engineers/technicians and users.
- Writing documents for both users and technicians.
- Working on the document structure and formatting across multiple supports.
- Creating detailed illustrations of the machine/equipment.
- Photo shoots and image editing.

We are committed to comply with the schedule and the customer standards. We assure the quality of customer documentation, good communication with all collaborators working on the project.

Our employees are trained on the office tools and desktop publishing. They master:

- InDesign, Photoshop, Illustrator, Word, Excel, PowerPoint and FrameMaker software tools.
- Reading mechanical drawings (to have a good understanding of the machine operation).

Finally, we have a dedicated stock of computing equipment with Adobe Creative Suite licenses that can be mobilized for your projects.
